

ABSTRACT

A pair of connecting pieces which can sandwich tabs of a corresponding terminal are provided at the edges of an internal terminal, both of the connecting pieces are formed in an L-shaped cantilevered form extending from left and right side faces facing each other to a lower face portion. A dielectric is preliminarily fixed on the internal terminal, and then, an assembly is formed by connecting the core wire of a shielded electric wire with the internal terminal. This assembly is fixed in an external terminal, and then, the net braid of the shielded electric wire is connected with the external terminal. The internal terminal is protected by the dielectric during assembly of the internal terminals and the external terminal.
